See every MIMO tablet on one map.

City and country names in the tablet registry become coordinates, country codes and time zones, so workplace and IT teams can see the whole estate.

PERSONA: WORKPLACE AND IT OPERATIONS

SOURCE: MIMO SQL REGISTRY

One bubble per city, sized by the number of tablets. Positions come from the enrichment, not from the database.

CUSTOMER CHALLENGE

The registry knows where a tablet is, but only in words.

Country and city are plain text. That is enough to list tablets, but not to draw them, group them by region or plan work by time zone.

CURRENT CHALLENGE

Estate questions need a spreadsheet.

Where are the tablets, how many per country, which building? The answers sit in a SQL database that nobody can see on a map.

WHAT THE REGISTRY HOLDS TODAY

Country	City
Site and building	Room
Capacity	Bookable
App version	Coordinates: none

HOW IT WORKS

One lookup turns text into coordinates.

The enrichment runs while the data is collected. Nothing changes in the MIMO database.

01

MIMO registry

SQL database with country, city, site, building and room for every tablet.

02

Elastic Agent

Reads the registry every 15 minutes and sends one document per tablet.

03

GeoNames lookup

About 208,000 cities loaded once. Adds coordinates, country code and time zone to each document.

04

Kibana

Map and dashboard, filtered by country, site or building.

EXAMPLE

`Munich, Germany` → `48.14, 11.57` `DE` `Europe/Berlin`

DEMO 01 · LEAD STORY

Go from the world to a single room.

The workplace team wants to know where the tablets are, how many, and in which building, without asking for an export.

PAIN

Estate questions need a spreadsheet.

The registry lists tablets, but nobody can see the estate by country, city or building at a glance.

ELASTIC APPROACH

Drill down on one live map.

Country shading at world level, city bubbles when you zoom in, then buildings and a room table, filtered by country or site.

- WORLD MAP
- COUNTRY FILTER
- BUILDING LIST
- ROOM TABLE

BENEFIT

One view that stays current.

The map refreshes every 15 minutes from the same database. No manual geocoding, no export.

689 TABLETS

41 CITIES

18 COUNTRIES

DEMO 02

Plan support and rollouts across 22 time zones.

An app update or restart should never land in the middle of an office day. The registry has no time zone; the enrichment adds one.

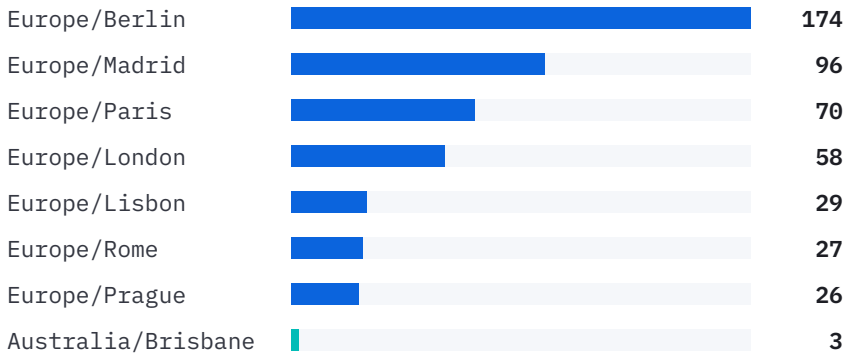

PAIN

Rollouts are planned by hand.

Without a time zone per office, nobody can tell which offices are open when an update goes out.

ELASTIC APPROACH

Group the fleet by time zone.

TABLETS PER TIME ZONE, 8 OF 22 SHOWN

BENEFIT

Roll out in waves, smallest zones first.

A bad update then touches a few rooms, not the largest offices. Support also knows which offices to expect a call from.

Location turns a registry into a planning tool.

The same enrichment works for any data that carries a city and a country.

See the estate.

Every tablet by country, city and building, on one live map.

Plan by time zone.

Roll out and support in waves, with the time zone added at ingest.

Reuse the lookup.

Load GeoNames once and geocode any other city and country field.

NEXT STEP

Detect a silent office.

Alert when a whole office stops reporting. This needs a heartbeat signal from the tablets.
